How to assemble your anti loss PIN

1

Initial Configuration for assembly.

Please note that the anti-loss PIN is to be installed on the V-Shaped Support marked with the **red-yellow color code**.

This is the one that features a through hole (non-threaded) on the joint plate connecting the two arms (unlike the blue-green support, which has a threaded hole instead).
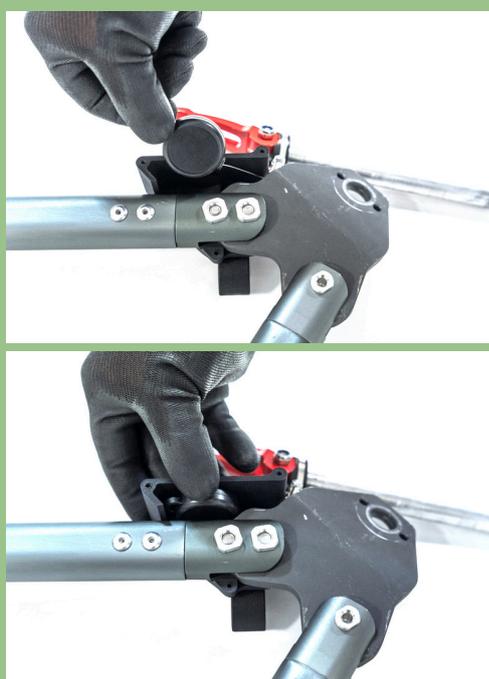

2

Take one half-shell of the anti-loss PIN and place it on the outer side of the V-Shaped Support.

Make sure to use the half-shell with the Ferno logo, and ensure the logo is facing outward.
The holes on the shell must align perfectly with the domed screw heads as shown in the picture.

3

Rotate the V-Shaped Support as shown in the reference image to facilitate the next steps.

4

Insert the retractable cable holder into its designated slot inside the shell. Make sure the wheel PIN remains outside the shell during placement.
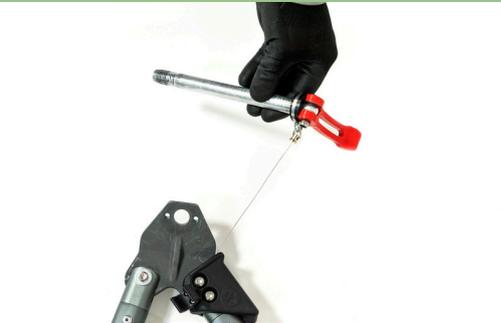

5

Position the second half-shell to enclose the cable holder completely and use the three included screws to fasten the two halves together. Tighten carefully to ensure a secure assembly without damaging components.

6

The anti-loss PIN is now correctly installed and ready for use.

ANTI LOSS PIN PROPER STORAGE

ANTI LOSS PIN WRONG STORAGE

7

When not in use, the PIN can be stored in the designated slot on the plastic casing. Make sure to place the PIN in the correct orientation.
